5 yrs PLATFORM & PRODUCT

1,500+ ENGINEERS SERVED DAILY

1 product BUILT SOLO, IN PRODUCTION

Five years building the tools other engineers rely on: today the deployment platform behind **1,500+ engineers at Criteo**, before that the edge platform and its CI/CD and observability stack at **Schneider Electric**. Comfortable owning a feature from the database schema to the React screen, and keeping it running once live. On the side I design, build and run **SignalAtlas**, a market-analysis product, from first commit to production. Open to remote freelance missions across Europe.

01 SKILLS

BUILD

TypeScript · React · Angular · React Native · C# / .NET · Groovy · Scala · Node.js · Python · Django · Go · C / C++ · SQL · AI agents · MCP

RUN

Docker · Kubernetes · Mesos · nginx · Concourse CI · GitHub Actions · GitLab CI · Helm · Ansible · Azure · Redis · MQTT · OPC UA · Modbus

OBSERVE & SECURE

OpenTelemetry · Prometheus · Grafana · OpenSearch · Jaeger · Logging · OAuth2 / OIDC · RBAC · GDPR

02 EXPERIENCE

Software Developer | Criteo · CD platform team, Paris — Sep 2025 – present

- Own features end to end on the deployment platform used by 1,500+ engineers: Groovy back end, Angular and React front ends in TypeScript, C# and Python services, Concourse CI, Mesos and Kubernetes.
- Maintain the manual deployment tool (Scala) and the configuration-as-code setup; reworked the deployment data schema and indexes (faster hot paths) and added Hangfire locking so instance operations stay atomic under concurrent use.
- Built an MCP server and AI agents that answer recurring support questions, plus Slack notifications for deployment events; the engineer on duty gets interrupted far less.
- Django REST / PostgreSQL work on an internal ad-operations platform: replaced a legacy Lua service with an audited `GET/PUT` API, a scoped LDAP-mapped service role and full permission tests.
- Product owner on several platform initiatives, from scoping to delivery and OKRs. Hired through a Big Tech-style loop (Google / Meta bar): algorithms, system design, behavioural rounds.

SIDE PROJECT · IN PRODUCTION

SignalAtlas | getsignalatlas.com — 2026 – present

Solo, with AI coding agents in the loop · React, TypeScript, Vite, React Native, Node.js, Python, Docker

- Web app in React, TypeScript and Vite; mobile app in React Native with Expo; Node.js and Python services behind both. Analysis engine in Python that turns market data into portfolio insights and automated alerts.
- Multi-service setup with Docker, nginx and Redis; builds, tests and releases automated with CI/CD. Sign-in with OAuth2 / OpenID Connect and role-based access; GDPR handled from the start.
- Grafana dashboards and structured logs in production; internal ops tooling; bilingual FR / EN, prerendered for SEO.

Software / DevOps Engineer, V.I.E. | Schneider Electric · R&D IoT, Boston, USA — May 2023 – Mar 2025

- Built Go and Python micro-apps for an IoT edge platform, deployed with Docker, Kubernetes and EdgeX Foundry; contributor to the MARGO open orchestration initiative. Stood up the CI/CD validation infrastructure (Robot Framework, GitHub Actions, Coverity, SonarQube).
- Prototyped, then integrated OpenTelemetry and OpenSearch as Go microservices, with exporters feeding Jaeger, Grafana, Zipkin and Prometheus.
- Designed the middleware between services (MQTT, Redis, OPC UA, Modbus) and the link from edge apps to Azure. Real-time PLC code in Structured Text; 300-person Agile organisation.

Edge Computing Engineer | Schneider Electric · Grenoble — Nov 2022 – Apr 2023

- C++ micro-apps and a Go prototype middleware deployed on existing devices; performance work on memory-constrained Linux devices (Modbus, pub/sub, MQTT) in C; CI/CD scripts in Python and shell.

Edge Computing Engineer, intern | Thales Alenia Space · Toulouse — Mar – Aug 2022

- Ported the CCSDS 122 image-compression algorithm to a Kalray many-core target and parallelised it over 80 cores (C / C++, OpenCL, OpenMP); Docker-based validation and GitLab CI in a 12-person proof-of-concept team.

Earlier (2020 – 2022): autonomous car on STM32MP1 with STMicroelectronics (GTK, lidar, BLE, A7 / M4 cores) · embedded C on Raspberry Pi for FlyTek, full V-cycle · full-stack internship at Orb Group, London (JavaScript, PHP, SQL).

03 EDUCATION & MORE

ESEO, Angers · 2017 – 2022

Engineering degree, software architecture and embedded systems; Rust, Linux drivers, real-time systems, AWS training.

Languages

French (native) · English (fluent) · Spanish, Portuguese (basics)

Beyond work

Guitar and live sound in a band, former chair of a music association; football, running.
